

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A method in a data processing system for indicating an end of a session, the method comprising:

receiving an identification of the session and a duration of ~~[[a]]~~ the session from a data structure containing a schedule of a date and time for each of a plurality of user sessions, wherein the data structure is a file for a calendar program that is installed on the data processing system and operable for calendaring the plurality of user sessions; and

responsive to receiving the identification of the session and the duration of the session, creating an audio file on a storage medium, wherein the audio file has a length equal to the duration of the session, wherein the audio file includes a silent segment followed by an audio segment and wherein the audio segment provides an indication of the end of the session when encountered during playing of the audio file, wherein a plurality of audio files are created on the storage medium in which each audio file corresponds to a given user session for a particular user according to the schedule of the plurality of user sessions.

2. (Cancelled)

3. (Currently Amended) The method of claim 1, ~~wherein the receiving step comprises receiving the identification and the duration of the session from a scheduling program further comprising sending the identification of the session and the duration of the session to another data processing system.~~

4. (Original) The method of claim 1, wherein the storage medium is one of a compact disc, a digital versatile disc, a flash memory, or an audio tape.

5. (Original) The method of claim 1, wherein the audio segment is music.

6. (Original) The method of claim 1, wherein the silent segment is 59 minutes long and the audio segment is 1 minute long for a 60 minute session.

7-11. (Cancelled)

12. (Currently Amended) A data processing system for indicating an end of a session, the data processing system comprising:

receiving means for receiving an identification of the session and a duration of [[a]] the session from a data structure containing a schedule of a date and time for each of a plurality of user sessions, wherein the data structure is a file for a calendar program that is installed on the data processing system and operable for calendaring the plurality of user sessions; and

creating means, responsive to receiving the identification of the session and the duration of the session, for creating an audio file on a storage medium, wherein the audio file has a length equal to the duration of the session, wherein the audio file includes a silent segment followed by an audio segment and wherein the audio segment provides an indication of the end of the session when encountered during playing of the audio file, wherein a plurality of audio files are created on the storage medium in which each audio file corresponds to a given user session for a particular user according to the schedule of the plurality of user sessions.

13. (Cancelled)

14. (Currently Amended) The data processing system of claim 12, ~~wherein the receiving means is a first receiving means which includes:~~

~~second receiving means for receiving the identification and the duration of the session from a scheduling program further comprising sending means for sending the identification of the session and the duration of the session to another data processing system.~~

15. (Original) The data processing system of claim 12, wherein the storage medium is one of a compact disc, a digital versatile disc, a flash memory, or an audio tape.

16. (Original) The data processing system of claim 12, wherein the audio segment is music.

17-22. (Cancelled)

23. (New) A computer program product encoded in a computer readable, recordable-type medium and operable by a data processing system for indicating an end of a session, the computer program product comprising:

first instructions for receiving an identification of the session and a duration of the session from a data structure containing a schedule of a date and time for each of a plurality of user sessions, wherein the data structure is a file for a calendar program that is operable for calendaring the plurality of user sessions; and

second instructions, responsive to receiving the identification of the schedule and the duration of the session, for creating an audio file on a storage medium, wherein the audio file has a length equal to the duration of the session, wherein the audio file includes a silent segment followed by an audio segment and wherein the audio segment provides an indication of the end of the session when encountered during playing of the audio file, wherein a plurality of audio files are created on the storage medium in which each audio file corresponds to a given user session for a particular user according to the schedule of the plurality of user sessions.

24. (New) The computer program product of claim 23, further comprising third instructions for sending the identification of the session and the duration of the session to another data processing system.

25. (New) The computer program product of claim 23, wherein the storage medium is one of a compact disc, a digital versatile disc, a flash memory, or an audio tape.
